a hierarchical series of organisms each dependent on the next as a source of food.

Bobcat is a shrubland species that is currently in danger of extinction. It is a medium sized-cat, about two feet tall and weighting 20 pounds. It is only found in the southwest of the U.S. Scattered reports of bobcats being seen or killed on roads continued throughout the 1950s and 1960s, and the species was listed as a state **endangered species** in June of 1991. In February of 1997, biologists captured three adult male bobcats to fit them with radio collars. This would allow them to track the bobcats and find out where they lived and hunted. In the actuality, Bobcats aren't hunted for food or to defend farms. Instead, they are killed entirely as trophies.
